BIOL-607 Biological Data Analysis Homework 1: Sampling and Simulation

Andrew Judell-Halfpenny September 21, 2018

1. R Warmup

1a. Create a vector of 100 randomly distributed numbers between 0 and 100 using runif and save the vector into the variable my_vec. If you cannot figure out runif, try ?runif. What information does str and summary tell you about my_vec? How do they differ?

```
# library initialization
library(dplyr)
## Attaching package: 'dplyr'
## The following objects are masked from 'package:stats':
##
##
       filter, lag
## The following objects are masked from 'package:base':
##
##
       intersect, setdiff, setequal, union
library(purrr)
library(magrittr)
##
## Attaching package: 'magrittr'
## The following object is masked from 'package:purrr':
##
       set_names
#random vector
my_vec<-runif(100, min=0, max=100)</pre>
class(my_vec)
## [1] "numeric"
str(my_vec)
## num [1:100] 34.26 33.26 92.74 9.06 32.44 ...
summary(my_vec)
     Min. 1st Qu. Median
                              Mean 3rd Qu.
     1.639 22.054 50.483 50.016 78.236 99.279
##
```

1a. Answer:

The str() function returns the class of the object, its dimensions, and returns the first few entries in the object.

1b. Try out a little plot. What does hist(my_vec) show you? What information does the helpfile for hist tell you about what you just did?

hist(my_vec)

Histogram of my_vec

??hist

1b. Answer:

The hist() function produces a simple histogram of an object. The helpfile produces a deluge of information about the type of data to which the function can be applied as well as the arguments that are expected by the function.

1c. Load up the mtcars data set using data(mtcars). Apply the following functions to mtcars: class, str, summary. What do these three functions tell you about mtcars?

```
data(mtcars)
class(mtcars)
```

[1] "data.frame"

```
str(mtcars)
   'data.frame':
                     32 obs. of 11 variables:

3rd Qu.:4.000

:5.000

Max.

1c. Answer:

Max.

3rd Qu.:1.0000

:1.0000

##

These functions describe the mtcars object as a data frame with 32 rows and 11 named columns of numeric data. The summary() function produces a five number summary for each column in the data frame that includes the minimum, mean, median, maximum, first quartile, and third quartile values.

3rd Qu.:4.000

:8.000

Max.

1d. Look at the help file for the class data.frame. What does it tell you about these objects?

```
??dplyr::data.frame
```

1d. Answer:

These files are not as strongly typed as matrices or numerics. They can accept strings, floats, integers, and even multiple values as entries within a single data frame object. Data frames can also include multiple classes of data in a single object.

2. Sample Properties

2a. Produce descriptive statistics for the following vasopressin expression levels in voles.

```
vole_vaso <- c(98,96,94,88,86,82,77,74,70,60, 59,52,50,47,40,35,29,13,6,5)
```

2b. What is the mean, median, sd, and interquartile range of the sample

```
mean(vole_vaso)

## [1] 58.05

median(vole_vaso)

## [1] 59.5

sd(vole_vaso)

## [1] 29.75244

IQR(vole_vaso)

## [1] 44.25
```

2c. What is the standard error of the mean (do this with a formula!)?

```
vole_vaso

## [1] 98 96 94 88 86 82 77 74 70 60 59 52 50 47 40 35 29 13 6 5

std.er <- function(x){
   output <-sd(x)/sqrt(length(x))
    return(output)}

std.er(vole_vaso)

## [1] 6.652849

sd(vole_vaso)

## [1] 29.75244</pre>
```

2d. What does the standard error of the mean tell you about our estimate of the mean values of the population of vole vassopressin?

2d. Answer:

The standard error of the mean is a measurement of the precision of the estimate of the mean of a population for a particular sample size of that population.

3. Sample Size for upper quartiles.

Let's assume this sample of vole vassopressin expression is representative of the popultion.

We can get the upper quartile value of vole vassopressin with

```
quantile(vole_vaso, probs = 0.75)
## 75%
## 83
```

3a. Use sample() to get just one resample with a sample size of 10. What is its upper quartile?

```
vole_vaso.resamped<-sample(x=vole_vaso,10, replace=T)
quantile(vole_vaso.resamped, probs=0.75)
## 75%
## 70</pre>
```

3b. Build an initial data frame for simulations with the sample sizes 5 through 20. Have 100 simulations per sample size.

```
# initialize data frame description
for (i in 5:20){
   sampSim <- data.frame(samp size=c(5:20),sim num=list(100))}</pre>
str(sampSim)
## 'data.frame':
                    16 obs. of 2 variables:
## $ samp size: int 5 6 7 8 9 10 11 12 13 14 ...
              : num 100 100 100 100 100 100 100 100 100 ...
# initialize data frame of appropriate size
for (i in 5:20){
   sampSim[[i]]<-map(i, ~data.frame(samp_size=rep(i,times=100)))}</pre>
str(sampSim)
## 'data.frame':
                   16 obs. of 20 variables:
   $ samp size: int 5 6 7 8 9 10 11 12 13 14 ...
## $ X100 : num 100 100 100 100 100 100 100 100 100 ...
##
               : NULL
```

```

4. SE and CI

4a. With the upper quartile simulations, calculate the SD for each sample size using dplyr

4b. What does this value, the standard error of the upper quartile, mean?

4c. What is the CI of the upper quartile with a sample size of 10. What does this mean?

```
for(i in 5:20){
   print(i)
   samp_sim.df<-data.frame<-map(1:100, ~map(5:20, ~sample(vole_vaso, size=i, replace=T)))}</pre>

4d. Extra Credit: Instead of having each sim calculate a upper quartile, and then sifting down to the SE of that upper quartile (or the CI), have each simulation calculate a CI. Then, for just a sample size of 10, how many CI's contain the true value of 83?
